1. PROJECT PROPOSAL

1.1 Background to the Problem

Hospitals must manage many different activities every day, such as patient registration, doctor and nurse information, appointments, room allocation, laboratory tests, billing, financial records, and report generation. In many small and medium-sized hospitals, these activities are still handled manually through paper files, registers, or separate spreadsheets. As a result, managing information becomes difficult when the number of patients and hospital activities increases.

One of the main problems is maintaining patient records properly. Paper-based files can be misplaced, damaged, or duplicated, and searching for an old record may take a long time. Appointment management can also become confusing when staff need to check doctor availability or change a patient's appointment. In the same way, room allocation, laboratory test records, and billing information may become difficult to manage when they are stored separately.

Manual billing can increase the chance of calculation errors, while separate records may create inconsistent information between different departments. These problems can slow down daily hospital activities and increase the workload of hospital staff.

To solve these issues, we propose a **Hospital Management System** that will bring the major hospital activities into one centralized system. The system will help authorized users manage patient information, doctors, nurses, appointments, rooms, laboratory tests, billing, financial records, reports, and other hospital activities in a more organized and efficient way.

Societal Issues

From a societal point of view, slow hospital procedures can create unnecessary waiting and inconvenience for patients. Manual registration, appointment booking, billing, and record searching often take more time because staff have to check information from different files or registers.

A centralized Hospital Management System can make these activities faster and more organized. Hospital staff will be able to access required information more easily, and patients can receive administrative services with less delay. The system can also reduce the amount of paperwork used in daily hospital activities and support the gradual use of digital services in healthcare organizations.

Health Issues

Proper patient information is important for hospital services. If patient records are incomplete, duplicated, or difficult to find, hospital staff may face problems when they need previous information or laboratory records.

The proposed system will keep patient information, admission records, and laboratory test results in an organized form. This will allow authorized users to find necessary information more quickly and reduce problems caused by missing or inconsistent records.

Safety Issues

Hospital information contains sensitive and important data. Unauthorized access, accidental changes, or data loss can create serious problems for a hospital.

For this reason, the system will include secure login, role-based access control, activity logging, and backup and recovery facilities. Users will only be able to access the functions allowed for their roles. Regular backups will also help protect important records if the system or database faces an unexpected failure.

Legal Issues

Patient information is private and should only be accessed by authorized hospital staff. Personal information, medical history, and laboratory records should not be available to users who do not need them for their responsibilities.

The proposed system will use authentication and role-based authorization to control access to sensitive information. Important activities, such as login and record updates, can also be logged so that changes can be traced when necessary.

Cultural Issues

Hospital staff may have different levels of computer knowledge, and some users may be more comfortable with traditional paper-based work. Therefore, the system should be simple and easy to understand.

The proposed Hospital Management System will use clear menus, simple forms, understandable labels, and consistent navigation so that users can perform their tasks without needing advanced technical knowledge. A user-friendly design can also make it easier for hospital staff to adapt from manual work to a digital system.

1.2 Selection of Process Model

Selected Process Model: Agile Scrum

For our Hospital Management System, we selected the Agile Scrum Model as the software development process model. Our system contains several separate but connected modules, including Patient Management, Doctor and Nurse Management, Appointment Management, Room Management, Laboratory Test Management, Billing, Financial Management, Reports, Notifications, Backup and Recovery, Dashboard and AI Chatbot Assistance.

Developing all of these modules at the same time would be difficult to manage. For this reason, Agile Scrum is suitable for our project because it allows us to divide the whole system into smaller parts and develop them step by step through short development cycles called Sprints.

In Scrum, the project requirements are first organized in a Product Backlog. The Product Backlog contains all required features and development tasks. Before starting Sprint, the team selects several tasks from the Product Backlog during Sprint Planning. These selected tasks become part of the Sprint Backlog.

During the Sprint, the team designs, develops, and tests the selected features. At the end of the Sprint, the completed work is reviewed to check whether it meets the project requirements. If any problem is found, it can be corrected before starting the next Sprint. This process continues until all major modules of the Hospital Management System are completed.

Scrum also supports teamwork because different group members can work on different assigned tasks while following the same Sprint goal. Trello can be used to manage Sprint tasks and user stories, while GitHub can be used to manage the source code and contributions of each group member.

Sprint Distribution

Sprint 1: Project Setup and Authentication

The first Sprint will focus on basic project setup, database preparation, secure login, logout, password authentication, and role-based access control.

Sprint 2: Patient Management

This Sprint will include patient registration, updating patient information, searching patient records, viewing patient history, and maintaining admission and discharge information.

Sprint 3: Doctor and Nurse Management

This Sprint will focus on doctor information, specialization, department assignment, doctor schedule, doctor availability, nurse information, department assignment, and duty-related records.

Sprint 4: Appointment and Room Management

This Sprint will include appointment booking, modification, cancellation, doctor availability checking, room availability, room allocation, and room release.

Sprint 5: Laboratory and Billing Management

This Sprint will cover laboratory test records, test results, patient billing, payment collection, receipt generation, and outstanding payment tracking.

Sprint 6: Salary, Finance and Reports

This Sprint will include employee salary management, hospital income and expense records, financial information, and different hospital reports.

Sprint 7: Dashboard, Notifications and Backup/Recovery

This Sprint will focus on dashboard analytics, appointment reminders, payment notifications, system alerts, database backup, and data recovery.

Sprint 8: AI Chatbot, Integration and Final Testing

The final Sprint will include AI Chatbot assistance, integration of all completed modules, final testing, bug fixing, and preparation of the final system.

Why We Chose Agile Scrum

We chose Agile Scrum because our Hospital Management System contains many different modules that can be developed in separate stages. Working in smaller Sprints allows the team to focus on a limited number of features at a time instead of trying to develop the whole system together.

Another reason is that completed features can be tested early. For example, after finishing Patient Management, we can test patient registration, searching, and updating before moving to another module. This helps us identify and fix problems earlier in the development process.

Scrum is also suitable for team-based development. Tasks can be divided among group members and tracked through Trello, while GitHub can be used to manage source code and individual contributions. This makes it easier to monitor progress and keep the work organized.

Agile Scrum is also flexible when small changes are needed during development. If a requirement needs improvement or additional validation, it can be handled in a later Sprint without changing the entire project plan.

Therefore, Agile Scrum is suitable for our Hospital Management System because it supports modular development, early testing, teamwork, progress tracking, and easier management of changes throughout the project.

2. Timeline Chart / Gantt Chart

3. SOFTWARE REQUIREMENTS SPECIFICATIONS (SRS)

3.1 Scopes and Features

The Hospital Management System covers the major administrative and operational activities of a hospital. The system includes patient management, doctor and nurse management, appointments, room allocation, laboratory test records, billing, salary, financial records, reports, user management, and several advanced features. **Scope 1: User Authentication and Security**

Description:

This module ensures that only authorized users can access the Hospital Management System.

Features:

- Secure Login

- Logout
- Password Authentication
- Role-Based Access Control
- User Authorization
- Session Management
- Password Update
- Account Security **Scope 2: Patient Management**

Description:

This module manages the complete lifecycle of patient information.

Features:

- Patient Registration
- Update Patient Information
- Delete Patient Record
- Search Patient
- View Patient History
- Emergency Contact
- Admission Record
- Discharge Record
- Patient Medical History
- QR Code Patient ID

Scope 3: Doctor Management

Description:

This module maintains complete information about doctors working in the hospital.

Features:

- Add Doctor
 - Update Doctor
 - Delete Doctor
 - Search Doctor
 - Doctor Schedule
 - Doctor Availability
 - Specialization Management
 - Department Assignment
 - Doctor Specialization
 - Store Doctor Contact Information
- Scope 4: Nurse Management**

Description:

This module manages nurse information and department-related responsibilities.

Features:

- Add Nurse
 - Update Nurse
 - Delete Nurse
 - Search Nurse
 - Assign Department
 - Duty Schedule
 - Attendance Record
- Scope 5: Appointment Management**

Description:

This module manages appointments between patients and doctors.

Features:

- Book Appointment
 - Modify Appointment
 - Cancel Appointment
 - Search Appointment
 - Check Doctor Availability
 - Appointment Reminder
 - Appointment History
- Scope 6: Room Management**

Description:

This module manages hospital room allocation and room availability.

Features:

- Add Room
- Allocate Room
- Release Room
- Room Status
- Room Availability
- ICU Room Management
- Cabin Management

Scope 7: Laboratory Test Management**Description:**

This module records and manages laboratory and diagnostic test information.

Features:

- Add Medical Test
- Record Test Result
- View Test Report
- Print Report
- Laboratory History

Scope 8: Billing and Payment Management**Description:**

This module handles hospital billing and payment-related activities.

Features:

- Automatic Bill Generation
- Payment Collection
- Receipt Generation
- Outstanding Payment Tracking
- Payment History
- Online Payment as a Future Enhancement

Scope 9: Employee Salary Management**Description:**

This module manages employee salary information.

Features:

- Salary Calculation
 - Salary Payment
 - Salary History
 - Salary Report
 - Bonus Management
- Scope 10: Financial Management**

Description:

This module maintains hospital income and expenditure records.

Features:

- Income Record
 - Expense Record
 - Current Balance
 - Financial Dashboard
 - Monthly Financial Report
- Scope 11: Reports Management**

Description:

This module generates reports for hospital management and monitoring.

Features:

- Patient Report
- Doctor Report
- Appointment Report
- Billing Report
- Financial Report
- Salary Report
- Room Utilization Report
- Daily Summary Report
- Monthly Summary Report

Scope 12: AI Chatbot Assistance

Description:

The AI Chatbot assists users by answering common questions and helping them use the system.

Features:

- Answer Frequently Asked Questions
- Guide Users
- Help Navigation
- System Assistance
- Basic Hospital Information **Scope 13: Dashboard and Analytics**

Description:

This module provides a real-time dashboard with graphical information and important hospital statistics.

Features:

- Daily Patient Count
- Doctor Availability Overview
- Appointment Statistics
- Revenue Summary
- Expense Summary
- Occupied Room Status
- Pending Payments
- Recent Activities

Scope 14: Notification System**Description:**

This module sends important alerts and notifications to improve communication and daily operations.

Features:

- Appointment Reminder
- Payment Notification
- Low Room Availability Alert
- System Notification
- Salary Notification

Scope 15: Backup and Recovery**Description:**

This module protects hospital data by creating backups and allowing recovery when necessary.

Features:

- Automatic Backup
- Manual Backup
- Database Restore
- Recovery Management
- Backup Verification

3.2 User Story Table

Story ID	User Role	User Story	Priority	Acceptance Criteria
US-01	Admin	As an Admin, I want to log in so that I can use the system securely.	High	Admin can log in with a valid username and password.
US-02	Receptionist	As a Receptionist, I want to log in so that I can do my daily work.	High	Receptionists can log in successfully.
US-03	Admin	As an Admin, I want to add a new patient so that patient information is saved.	High	New patient information is saved successfully.
US-04	Receptionist	As a Receptionist, I want to register patients so that they can receive treatment.	High	Patient registration is completed successfully.
US-05	Admin	As an Admin, I want to update patient information so that records stay correct.	High	Patient information is updated successfully.
US-06	Admin	As an Admin, I want to delete patient records so that wrong or duplicate records are removed.	Medium	Patient records are deleted successfully.
US-07	Admin	As an Admin, I want to search patient records so that I can find patient information quickly.	High	Patient record is displayed correctly.
US-08	Admin	As an Admin, I want to manage doctor information so that doctor records stay updated.	High	Doctor information can be added, updated, deleted, and searched.
US-09	Admin	As an Admin, I want to manage nurse information so that nurse records stay organized.	High	Nurse information is managed successfully.

US-10	Admin	As an Admin, I want to assign nurses to departments so that hospital work runs smoothly.	Medium	Nurse is assigned to the selected department.
US-11	Receptionist	As a Receptionist, I want to book appointments so that patients can meet doctors on time.	High	Appointment is booked successfully.
US-12	Receptionist	As a Receptionist, I want to update appointments so that schedule changes are saved.	High	Appointment is updated successfully.
US-13	Receptionist	As a Receptionist, I want to cancel appointments when needed.	Medium	Appointment is cancelled successfully.
US-14	Admin	As an Admin, I want to assign rooms to patients so that admitted patients have a room.	High	Room is assigned successfully.
US-15	Receptionist	As a Receptionist, I want to check room availability so that I can assign an available room.	High	Available rooms are shown correctly.
US-16	Admin	As an Admin, I want to manage laboratory tests so that patient test results are saved.	High	Test information is saved successfully.
US-17	Admin	As an Admin, I want to generate bills so that patients are charged correctly.	High	Bill is generated successfully.
US-18	Receptionist	As a Receptionist, I want to receive payments so that payment records are updated.	High	Payment is recorded successfully.
US-19	Receptionist	As a Receptionist, I want to print receipts so that patients receive payment proof.	Medium	Receipt is generated successfully.
US-20	Admin	As an Admin, I want to manage employee salaries so that staff are paid correctly.	Medium	Salary information is saved successfully.
US-21	Admin	As an Admin, I want to manage income and expenses so that financial records stay correct.	High	Income and expense records are saved successfully.
US-22	Admin	As an Admin, I want to generate reports so that I can check hospital activities.	High	Reports are generated successfully.

US-23	Admin	As an Admin, I want to view the dashboard so that I can monitor hospital performance.	Medium	Dashboard displays updated hospital information.
US-24	Admin	As an Admin, I want to send notifications so that users receive important updates.	Medium	Notifications are sent successfully.
US-25	Admin	As an Admin, I want to back up the database so that hospital data remains safe.	High	Database backup is completed successfully.
US-26	Admin	As an Admin, I want to restore backup data so that lost information can be recovered.	High	Database is restored successfully.
US-27	Admin	As an Admin, I want to use the AI Chatbot so that I can get quick help.	Low	AI Chatbot provides helpful answers.
US-28	Receptionist	As a Receptionist, I want to use the AI Chatbot so that I can get help while working.	Low	AI Chatbot answers hospital-related questions.
US-29	Admin	As an Admin, I want to log out so that my account stays secure.	High	User logs out successfully.
US-30	Receptionist	As a Receptionist, I want to log out after work so that no one else can use my account.	High	Logout is completed successfully.

3.3 Requirements Traceability Matrix

For this system, the RTM is divided into **Functional Requirements** and **Non-Functional Requirements**. The functional requirements describe the main operations that the system must perform, such as patient registration, appointment management, billing, report generation, and backup and recovery. The non-functional requirements describe the expected quality of the system, including usability, performance, security, reliability, availability, maintainability, and data integrity.

Using the RTM makes it easier to track each requirement throughout the development process and reduces the chance of missing any important feature during design, implementation, and testing.

3.3.1 Functional Requirements

FR ID	Functional Requirement	Related User Story	Related Use Case	Priority	Status
FR-01	User Login	US-01, US-02	Login	High	Planned
FR-02	User Logout	US-29, US-30	Logout	High	Planned
FR-03	Register Patient	US-03, US-04	Patient Management	High	Planned
FR-04	Update Patient Information	US-05	Patient Management	High	Planned
FR-05	Delete Patient Record	US-06	Patient Management	Medium	Planned
FR-06	Search Patient	US-07	Patient Management	High	Planned
FR-07	View Patient History	US-07	Patient Management	Medium	Planned
FR-08	Manage Doctor Information	US-08	Doctor Management	High	Planned
FR-09	Manage Nurse Information	US-09	Nurse Management	High	Planned
FR-10	Assign Nurses to Departments	US-10	Nurse Management	Medium	Planned
FR-11	Book Appointment	US-11	Appointment Management	High	Planned
FR-12	Update Appointment	US-12	Appointment Management	High	Planned
FR-13	Cancel Appointment	US-13	Appointment Management	Medium	Planned
FR-14	Assign Hospital Room	US-14	Room Management	High	Planned
FR-15	Check Room Availability	US-15	Room Management	High	Planned
FR-16	Manage Laboratory Tests	US-16	Laboratory Test Management	High	Planned
FR-17	Generate Patient Bill	US-17	Billing Management	High	Planned
FR-18	Receive Payment	US-18	Billing Management	High	Planned

FR-19	Generate Payment Receipt	US-19	Billing Management	Medium	Planned
FR-20	Manage Employee Salary	US-20	Salary Management	Medium	Planned
FR-21	Manage Hospital Finance	US-21	Financial Management	High	Planned
FR-22	Generate Reports	US-22	Report Management	High	Planned
FR-23	View Dashboard & Analytics	US-23	Dashboard & Analytics	Medium	Planned
FR-24	Send Notifications	US-24	Notification System	Medium	Planned
FR-25	Backup & Restore Database	US-25, US-26	Backup & Recovery	High	Planned
FR-26	AI Chatbot Support	US-27, US-28	AI Chatbot	Low	Planned

3.3.2 Non-Functional Requirements

Requirement ID	Requirement Category	Non-Functional Requirement
NFR-01	Usability	The system should be easy to learn and use for both Admin and Receptionist.
NFR-02	Usability	The system should have a simple and user-friendly interface.
NFR-03	Performance	The system should respond to user requests within 3 seconds under normal conditions.
NFR-04	Performance	The system should generate reports within a reasonable time.
NFR-05	Security	Only authorized users should be able to access the system.
NFR-06	Security	Users must log in with a valid username and password.
NFR-07	Security	Patient information should remain private and secure.
NFR-08	Reliability	The system should work properly during hospital working hours with minimal errors.
NFR-09	Reliability	The system should save data correctly without losing information.
NFR-10	Availability	The system should be available whenever hospital staff need it.

NFR-11	Backup & Recovery	The system should support regular database backup.
NFR-12	Backup & Recovery	The system should restore data from backup if data is lost or the system fails.
NFR-13	Maintainability	The system should be easy to update and maintain in the future.
NFR-14	Scalability	The system should support adding more users, patients, doctors, and hospital services in the future.
NFR-15	Compatibility	The system should work correctly with the selected database and development platform.
NFR-16	Data Integrity	The system should store accurate and consistent data.
NFR-17	Logging	The system should keep a log of important user activities such as login and record updates.
NFR-18	Notification	The system should send notifications without unnecessary delay.
NFR-19	AI Support	The AI Chatbot should provide helpful responses for common hospital-related questions.
NFR-20	Portability	The system should be easy to install and run on another computer with the required software.

4. SOFTWARE DESIGN

4.1 System Design:

The system design of the Hospital Management System shows how the main users interact with different functions of the system. In this project, the **Admin** and **Receptionist** are the main actors. The Admin manages the major hospital operations, while the Receptionist mainly handles patient registration, appointments, billing, payments, reports, and other front-desk activities.

4.2 UI / Wireframe Design using Figma

Hospital Management System

Secure and organized hospital operations for modern healthcare management.

Basic hospital Info

Example Uses

How to register a patient

How to book an appointment

How to check room availability

How to receive a payment

How to generate a receipt

5. GIT WORKFLOW

- Create a central repository for the project on GitHub and set the master (or main) branch as the primary branch for integration.
- Each member should clone the repository and create their own feature branches for assigned tasks. Work on new features or fixes within these branches.
- Add files based on **Trello cards**, stage them and commit changes with clear messages that describe the purpose of each update. The text files (where the card serial, description are available based on Trello board) should be uploaded in the Git repository.
- Push commits from the feature branches to the remote repository so other members can see progress.
- Use pull to fetch and integrate changes from the remote repository into local copies, ensuring everyone stays updated.
- Merge feature branches into the master/main branch only after the work is tested and reviewed, resolving any conflicts that occur.
- Show evidence of collaboration by maintaining a clear commit history (using logs) with multiple commits, merges and contributions from all group members.
- Keep the repository organized with a clean history that tracks the project workflow from initialization to completion.
- Lastly, add the “Final Trello Board” screenshot in this section.

6. CONCLUSION

- Write a conclusion within 180 to 200 words.

Instructions:

- Minimum of 3 members and Maximum of 5 members per group.
- Font: Times New Roman ; Size: 12; Justify the para [Ctrl + J].
- Delete the highlighted part after completing this project report.
- The completed report should be within the range of 35 to 40 pages.
- **Submission:** Bring a hard copy (with spiral binding) of this report [per group] on the project evaluation day. Also, you will need to upload the soft copy later.
